LAB REPORT
On
DATA STRUCTURES (23CS3PCDST)

Submitted by:
Ridhima Suhane
(1BM23CS266)

In partial fulfillment for the award of the degree of

BACHELOR OF ENGINEERING
in
COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING
(Autonomous Institution under VTU)
BENGALURU - 560019

September2024-January2025

B.M. S. College of Engineering,
Bull Temple Road, Bangalore 560019
(Affiliated To Visvesvaraya Technological University, Belgaum)
Department of Computer Science and Engineering

This is to certify that the Lab work entitled **"DATA STRUCTURES"** carried out by **RIDHIMA SUHANE (1BM23CS266)** who is bonafide student of **B. M. S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum during the year 2024-25. The Lab report has been approved as it satisfies the academic requirements in respect of Data structures Lab - **(23CS3PCDST)** work prescribed for the said degree.

Prof. Lakshmi Neelima M
Assistant Professor
Department of CSE
BMSCE, Bengaluru

Dr.Kavitha Sooda
Professor and Head
Department of CSE
BMSCE, Bengaluru

Index Sheet

Course outcomes:

CO1	Apply the concept of linear and non-linear data structures.
CO2	Analyze data structure operations for a given problem
CO3	Design and Develop solutions using the operations of linear and non linear data structure for a given specification.
CO4	Conduct practical experiments for demonstrating the operations of different Data structures.

Lab program 1

Write a program to simulate the working of stack using an array with the following:
a) Push
b) Pop
c) Display
The program should print appropriate messages for stack overflow, stack underflow.

```
#include <stdio.h>
#include <stdlib.h>
#define max 5

int stack[max];
int top = -1;

void push(int value) {
   if (top == max - 1) {
      printf("Stack overflow!\n");
      printf("Cannot push %d into the stack\n", value);
   } else {
      top++;
      stack[top] = value;
      printf("%d pushed into the stack\n", value);
   }
   printf("Element pushed\n");
}

void pop() {
   if (top == -1) {
      printf("Stack underflow!\n");
      printf("Cannot pop from the stack\n");
   } else {
      int value = stack[top];
      printf("%d popped from the stack\n", value);
      top--;
   }
}

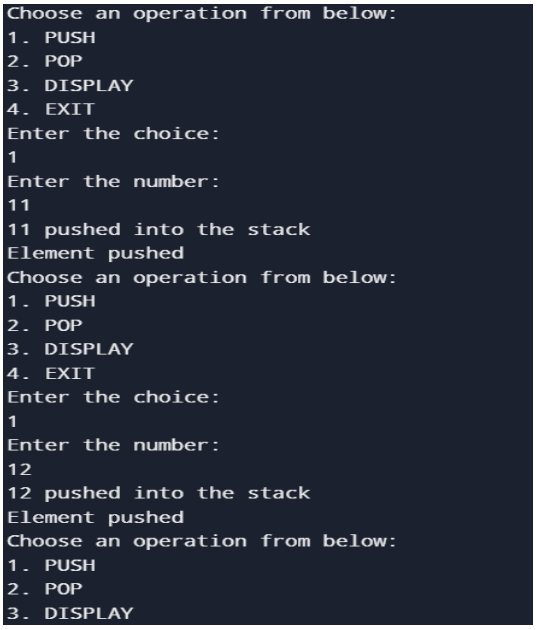
void display() {
   if (top == -1) {
      printf("Stack is empty\n");
   } else {
      printf("Stack elements are:\n");
      for (int j = top; j >= 0; j--) {
         printf("%d\t", stack[j]);
      }
      printf("\n");     }
```

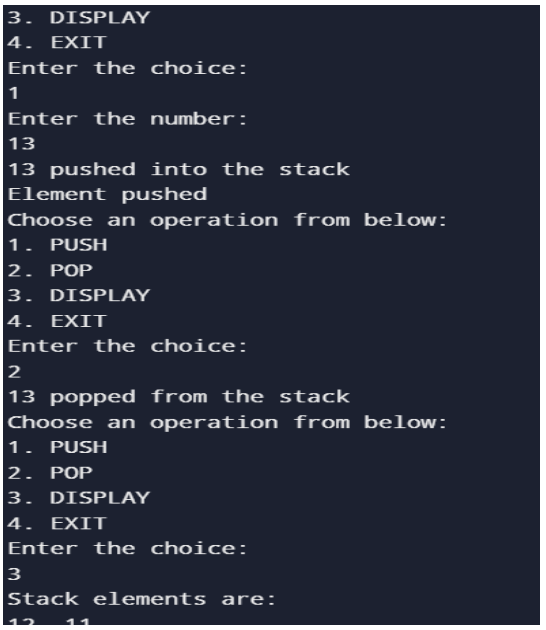
```
}

int main() {
   int CHOICE, value;
   while (1) {
      printf("Choose an operation from below:\n");
      printf("1. PUSH\n");
      printf("2. POP\n");
      printf("3. DISPLAY\n");
      printf("4. EXIT\n");
      printf("Enter the choice:\n");
      scanf("%d", &CHOICE);

      switch (CHOICE) {
         case 1:
            printf("Enter the number:\n");
            scanf("%d", &value);
            push(value);
            break;
         case 2:
            pop();
            break;
         case 3:
            display();
            break;
         case 4:
            exit(0);
         default:
            printf("TRY AGAIN!\n");
      }
   }
```

Output





Lab program 2

WAP to convert a given valid parenthesized infix arithmetic expression to postfix expression. The expression consists of single character operands and the binary operators + (plus), - (minus), * (multiply) and / (divide)

```
#include<stdio.h>
#include<string.h>
int top=-1,pos=0,length,index0=0;
char symbol,temp,infix[50],postfix[50],stack[50];
void push(char symbol);
char pop();
void infixtopostfix();
int predefined(char);
void main()
{
   printf("enter the infix expression:\n");
   scanf("%s",infix);
   infixtopostfix();
   printf("infix expression:%s",infix);
   printf("\npostfix expression:%s",postfix);
}
void infixtopostfix()
{
   length=strlen(infix);
   while(index0<length)
   {
      symbol=infix[index0];
      switch(symbol)
      {

         case ')':
            temp=pop();
            while(temp!='(')
            {
               postfix[pos]=temp;
               pos++;
               temp=pop();
            }

            break;
         case'(':
            push(symbol);
            break;
         case '*':
         case '/':
         case'^':
```

```
            case '+':
            case '-':
               while(predefined(stack[top])>=predefined(symbol))
               {
                  temp=pop();
                  postfix[pos++]=temp;
               }
               push(symbol);
               break;
            default:
               postfix[pos++]=symbol;
            }
            index0++;

      }
       while(top>0)
         {
            temp=pop();
            postfix[pos++]=temp;
         }
   }
   char pop()
   {
      char symb;
      symb=stack[top];
      top--;
      return symb;
   }
   void push(char symbol)
   {
      top++;
      stack[top]=symbol;
   }
   int predefined(char symbol)
   {
      int p;
      switch(symbol)
      {
         case '^':
            p=3;
            break;
         case '*':
         case '/':
            p=2;
            break;
         case '+':
         case '-':
            p=1;
            break;
         case '(':
            p=0;
```

```
            break;
        default:
            p=-1;
            break;

    }
    return p;
}
```

Output

```
enter the infix expression:
a*b+(c^d)/(e-f)
infix expression:a*b+(c^d)/(e-f)
postfix expression:ab*cd^ef-/
```

Lab program 3

LEETCODE PROGRAM 1

Given an array nums of size n, return *the majority element*.
The majority element is the element that appears more than ⌊n / 2⌋ times.
You may assume that the majority element always exists in the array.

```
int majorityElement(int* nums, int numsSize) {
    int i;
     int maj=nums[0];
     int cnt=0;
     for(i=0;i<numsSize;i++)
     {
       if(cnt==0)
       {
          maj=nums[i];
       }
       if(nums[i]==maj)
       {
           cnt++;
       }
       else
       {
          cnt--;
       }
    }
    return maj;
}
```

Output

Input: nums = [3,2,3]
Output: 3
Input: nums = [2,2,1,1,1,2,2]
Output: 2

Lab program 4

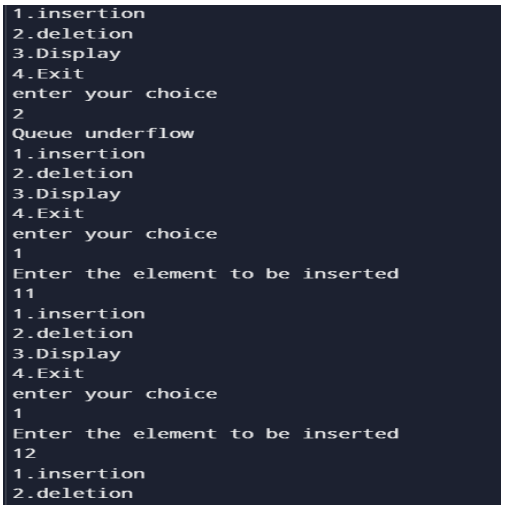
WAP to simulate the working of a queue of integers using an array. Provide the following operations:
Insert,Delete, Display The program should print appropriate messages for queue empty and queue overflow conditions.

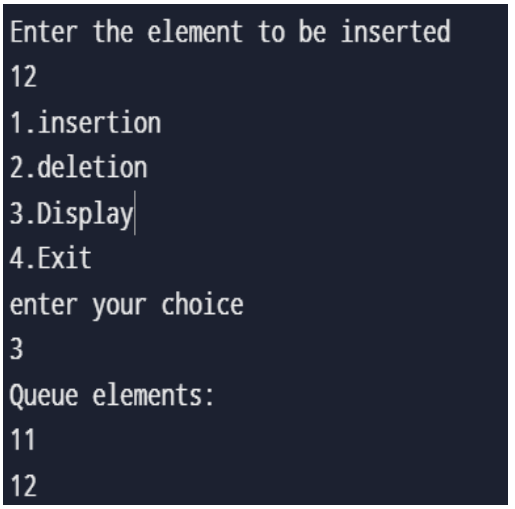
```
#include <stdio.h>
#include <stdlib.h>
#define size 3
int Q[size];
int rear=-1;
int front=-1;
void delete1();
void insert1();
void display1();
int main()
{
   int choice;
   while(1)
      {
         printf("1.insertion\n");
         printf("2.deletion\n");
         printf("3.Display\n");
         printf("4.Exit\n");
         printf("enter your choice\n");
         scanf("%d",&choice);
         switch(choice)
         {
            case 1:insert1();
            break;
            case 2:delete1();
            break;
            case 3:display1();
            break;
            case 4:exit(1);
            default:
               printf("Invalid input\n");
         }
      }
      return 0;
}
void insert1()
{
   int item;
   if(rear==(size-1))
   {
      printf("Queue Overflow\n");
   }
   else
   {
      if(front ==-1)
```

```
        front=0;
        printf("Enter the element to be inserted\n");
        scanf("%d",&item);
        rear=rear+1;
        Q[rear]=item;
    }
}
void delete1()
{
    if(front==-1||front>rear)
    {
        printf("Queue underflow\n");
        return;
    }
    else
    {
        printf("Deleted element is:%d\n",Q[front]);
        front=front+1;
    }
}
void display1()
{
    int i;
    if(front==-1)
    {

        printf("Queue is Empty\n");
    }
    else
    {
        printf("Queue elements:\n");
        for(i=front;i<=rear;i++)
        {
            printf("%d\n",Q[i]);
        }
    }
}
```

Output





WAP to simulate the working of a circular queue of integers using an array. Provide the following operations:
Insert, Delete & Display The program should print appropriate messages for queue empty and queue overflow conditions.

```
#include <stdio.h>
#include <stdlib.h>
#define size 3
int Q[size];
int rear=-1;
int front=-1;
void delete1();
void insert1();
void display1();
int main()
{
   int choice;
   while(1)
      {
         printf("1.insertion\n");
         printf("2.deletion\n");
         printf("3.Display\n");
         printf("4.Exit\n");
         printf("enter your choice\n");
         scanf("%d",&choice);
         switch(choice)
         {
            case 1:insert1();
            break;
            case 2:delete1();
            break;
            case 3:display1();
            break;
            case 4:exit(1);
            default:
               printf("Invalid input\n");
         }
      }
      return 0;
}
void insert1()
{
   int item;
   if(rear==(size-1))
   {
      printf("Queue Overflow\n");
   }
   else
   {
      if(front ==-1)
      front=0;
```

```
            printf("Enter the element to be inserted\n");
            scanf("%d",&item);
            rear=rear+1;
            Q[rear]=item;
        }
    }
    void delete1()
    {
        if(front==-1||front>rear)
        {
            printf("Queue underflow\n");
            return;
        }
        else
        {
            printf("Deleted element is:%d\n",Q[front]);
            front=front+1;
        }
    }
    void display1()
    {
        int i;
        if(front==-1)
        {

            printf("Queue is Empty\n");
        }
        else{
            printf("Queue elements:\n");
            for(i=front;i<=rear;i++)
            {
                printf("%d\n",Q[i]);
            }
        }
}
```

Output:

```
enter your choice
1
Enter the element to be inserted
46
1.insertion
2.deletion
3.Display

Enter the element to be inserted
45
1.insertion
2.deletion
3.Display
4.Exit
```

Lab program 5

Write a program to perform insertion and deletion in linked list.

```
#include <stdio.h>
#include <stdlib.h>
struct Node {
    int data;
    struct Node* next;
};
struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->next = NULL;
    return newNode;
}
void insertAtBeginning(struct Node** head, int data) {
    struct Node* newNode = createNode(data);
    newNode->next = *head;
    *head = newNode;
}
void insertAtEnd(struct Node** head, int data) {
    struct Node* newNode = createNode(data);
    if (*head == NULL) {
        *head = newNode;
        return;
    }
    struct Node* temp = *head;
    while (temp->next != NULL) {
        temp = temp->next;
    }
    temp->next = newNode;
}
void insertAfterNode(struct Node* prevNode, int data) {
    if (prevNode == NULL) {
        printf("The previous node cannot be NULL\n");
        return;
    }
    struct Node* newNode = createNode(data);
    newNode->next = prevNode->next;
    prevNode->next = newNode;
}
void deleteByValue(struct Node** head, int value) {
    struct Node* temp = *head;
    struct Node* prev = NULL;

    if (temp != NULL && temp->data == value) {
        *head = temp->next;
        free(temp);
        return;
    }
    while (temp != NULL && temp->data != value) {
        prev = temp;
```

```
        temp = temp->next;
    }

    if (temp == NULL) {
        printf("Node with value %d not found\n", value);
        return;
    }

    prev->next = temp->next;
    free(temp);
}
void deleteByPosition(struct Node** head, int position) {
    if (*head == NULL) return;

    struct Node* temp = *head;

    if (position == 0) {

                printf("Invalid choice, please try again.\n");
        }
    }

    return 0;
}
```

Output:

```
Menu:
1. Insert at Beginning
2. Insert at End
3. Insert After a Specific Node
4. Delete Node by Value
5. Delete Node by Position
6. Print List
7. Exit
Enter your choice: 1
Enter value to insert at the beginning: 11

Menu:
1. Insert at Beginning
2. Insert at End
3. Insert After a Specific Node
4. Delete Node by Value
5. Delete Node by Position
6. Print List
7. Exit
Enter your choice: 2
Enter value to insert at the end: 22

Menu:
1. Insert at Beginning
2. Insert at End
```

```
3. Insert After a Specific Node
4. Delete Node by Value
5. Delete Node by Position
6. Print List
7. Exit
Enter your choice: 3
Enter value to insert after: 22
Enter value to insert after node with value 22: 33

Menu:
1. Insert at Beginning
2. Insert at End
3. Insert After a Specific Node
4. Delete Node by Value
5. Delete Node by Position
6. Print List
7. Exit
Enter your choice: 4
Enter value to delete: 22

Menu:
1. Insert at Beginning
2. Insert at End
3. Insert After a Specific Node
4. Delete Node by Value
```

```
4. Delete Node by Value
5. Delete Node by Position
6. Print List
7. Exit
Enter your choice: 6
Linked List: 11 -> 33 -> NULL

Menu:
1. Insert at Beginning
2. Insert at End
3. Insert After a Specific Node
4. Delete Node by Value
5. Delete Node by Position
6. Print List
7. Exit
Enter your choice: 7
```

Lab program 6

WAP to Implement Single Link List with following operations: Sort the linked list, Reverse the linked list, Concatenation of two linked lists.

```
#include <stdio.h>
#include <stdlib.h>
struct Node {
    int data;
    struct Node* next;
};
struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->next = NULL;
    return newNode;
}
void append(struct Node** head, int data) {

output

```
Press 1. Insert  2. Display     3. Search   4. Exit
1

Enter a value to insert into hash table: 11
Number of probes for 11 is 10
Press 1. Insert  2. Display     3. Search   4. Exit
1

Enter a value to insert into hash table: 12
Number of probes for 12 is 11
Element cannot be inserted

Press 1. Insert  2. Display     3. Search   4. Exit
2

Elements in the hash table are:
At index 0   value = 11
At index 1   value = 0
At index 2   value = 0
At index 3   value = 0
At index 4   value = 0
At index 5   value = 0
At index 6   value = 0
At index 7   value = 0
At index 8   value = 0
```

```
Press 1. Insert  2. Display     3. Search   4. Exit
3

Enter search element: 7

Value is not found

Press 1. Insert  2. Display     3. Search   4. Exit
5
```
